TITLE: The effectiveness of radio-teleprinter communications is  
increased

SOURCE: Vestnik protivovozdushnoy oborony, no. 10, 1965, 62-65

TOPIC TAGS: radio teletype system, teletype equipment, radio relay, radio  
communication, radio equipment, electronic circuit, antenna, circuit design

ABSTRACT: General aspects of the radio-teletype transmission were outlined in the paper and possible applications of various devices and methods were suggested. The use of the EIS-1 apparatus was recommended for determining the levels and signs of distortions. It can also be used as an electron-beam oscilloscope for wave-form measurements. A general switch interconnecting all radio-teletype receivers, keyer lines and telegraph sets can successfully be used in connection with the EIS-1 device for controlling radio-channels and for location of faults. In discussing the keying technique, it was mentioned that due to peculiar field conditions a straight transmitting keying was used bypassing the receiving keyer. The use of an additional relay of RP-4 type

Card 1/3

1/3  
B

ACC NR: AP6009592

inserted between the electron-tube keyer and the line at the receiving end was recommended. The relay circuit was described and diagrammatically illustrated. This relay was also applied to the keying system formed either by a R-400-m telegraph set with a P-313 secondary circuit or by a R-401-m set and P-314 circuit. The arrangement and operation of these two versions were briefly explained. The selection of antennas was also discussed. An ordinary rod antenna can successfully be used for distances up to 200 km, while for ranges over 800 km a high-directional antenna of a vertical half-rhombic type was recommended. The efficiency of horizontal dipoles of VGD or especially of VGDSh types was stressed and their radiation patterns were presented in a diagram for three various heights of suspensions. The reliability of transmission was assured by continuous checking of the prevailing conditions in the ionosphere. The observations were conducted by the specialists of the same military radio unit. The use of two channels of separated frequencies for the same transmission increased the reliability of communication. The proper selection of frequencies was considered. The possibility of applying a motor-starting device (described by Tkachuk in "Tekhnika i vooruzheniye" no. 5, 1962) to radio-teletype system was discussed. The device being initially designed for wire communications must be modified (replacement of relays) and the trans-

Translation from: Referativnyy zhurnal, Geologiya, 1957, Nr 5,  
pp 127-128 (USSR)

AUTHORS: Berkman, A., Leybman, I.<sup>M.</sup>, Savenkov, S.

TITLE: Improvement in the Quality of Bricks From Low Plasticity Clays (Povysheniye kachestva kirpicha iz malo-plastichnykh glin)

PERIODICAL: Stroit. materialy, izdeliya i konstruktsii, 1956,  
Nr 9, pp 24-25.

ABSTRACT: The plasticity of the banded clays in the Neva region (Leningradskaya oblast) has the following limits: the "Krasnukha" clays, 9.5 to 11; the "Sinyukha" clays, 8.6 to 11.4; and the "Sizovka" clays, 19.9 to 33.6. A mixture of these clays, mixed in the excavation pit, had an overall plasticity of 11.2 to 13.8 and the products of this mixture invariably developed massive fractures (up to 60 percent of the entire object or article) during drying. To eliminate spoilage, it was

Card 1/2

15-57-5-6590

Improvement in the Quality of Bricks (Cont.)

necessary to increase the overall plasticity of the clays. Part of the "Krasnukha" clays were first discarded in the pit, thus increasing the percent of "Sinyukha" clays in the mixture. This selection raised the plasticity to 18.5 to 26 and the cracking was entirely eliminated. The author considers it unacceptable to reduce the plasticity to a value below 16. Other low-plasticity clays at the Krutyanskiy zavod (factory) (Komi ASSR), which produced fracturing, were improved by the addition of plastic clays from other pits.

Leybman, Moisey Yefimovich

Impul'snaya tekhnika (Pulse Technique) Moscow, Oborongiz, 1960. 206 p.  
21,000 copies printed.

Reviewers: V.G. Frolkin, Candidate of Technical Sciences, and Ye. L. Khrisanov,  
Engineer; Ed.: A.I. Ivanov-Tsyganov, Candidate of Technical Sciences; Managing  
Ed.: S.D. Krasil'nikov, Engineer; Ed. of Publishing House: P.B. Morozova;  
Tech. Ed.: N.A. Pukhlikova.

PURPOSE: This book has been approved by the Ministry of Higher and Secondary  
Education, RSFSR, as a textbook for schools of higher technical education.

COVERAGE: The author introduces the reader to the methods of analysis of transients  
in linear circuits, to various methods of obtaining pulse voltages, to the work  
of generators of linearly growing voltages, and to the methods of correcting  
the performance of such generators. He presents descriptions of free-running and  
driven multivibrators, phantastrons and blocking oscillators; he gives examples  
of pulse-technique application in the target-range and angular-coordinate

TITLE: A means of erecting railroad bridges of arched-span construction from  
separate sections. Class 19, No. 178393

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 3, 1966, 28

TOPIC TAGS: bridge, bridge construction, structural engineering, railroad bridge,

ABSTRACT: This Author Certificate presents a means for erecting railroad bridges of  
arched span construction from separate sections. The sections are suspended and  
joined with struts of the structure above the arch by temporary sloping and horizontal  
members. These members serve as cross-stays and upper booms. The sections also  
feature a cantilever truss (see Fig. 1) with a triangular framing, the lower girder  
of which forms a semi-arch. The upper girder of the cantilever truss is set above  
the travel span, which includes separate elements of the truss used in mounting and  
elevating the structure. These members subsequently form a triangular cantilever

ACC NR: AP6007660

Fig. 1. 1 - upper string of the cantilever truss; 2 - struts; 3 - slanting members; 4 - lower string panels; 5 - anchor post; 6 - key block; 7 - floor plates; 8 - cables; 9 - anchor block; 10 - tension cables; 11 - joints.

frame, cross-stays and semi-arch sections. Each panel thus formed serves as a support for the next panel. The panels are rigidly fastened along the entire face, the process being repeated until the entire semi-arch is formed. Then cables are placed between the link sections and the support. When the cables are tightened, the semi-arches are rotated with respect to the support section, thus unloading the diagonal and horizontal members of the cantilever. The cables are removed, after which the travel-span plates are placed upon the structure above the arch between the link sections of the semi-arch and the support. When the wearing surface is completely laid, the remaining part of the cables is tightened. Favorable working conditions for the support are created by freeing the support from one-sided loadings; assembly of the semi-arch takes place simultaneously on both sides of the pier, with each addition being a cantilever addition. The abutment portion of the semi-arch is prepared in place between the first support block of the semi-arch and the pier. Forces in members of the cantilever are lessened by the introduction of stiffener cables in the upper girder at 1/2--2/3 of its design length. Moments in panels on the semi-arch are reduced through a skewed arrangement of axes of diagonals relative to points of intersection of the axes of vertical members and the semi-arch blocks. Joints are placed between adjacent semi-arches on the assembled panels, thus controlling the position of cantilever frames in the span. Orig. art. has 1 figure.

Title : Electronic instruments for measuring distortion of start-stop (manual) telegraph signals

Periodical : Vest. svyazi 6, 6-8, June 1955

Abstract : Operational principles of two electronic instruments designated to measure distortion in manual telegraph signals, are described. One of the instruments automatically controls the telegraph channel and signals the raise and magnitude of distortions, and the other instrument, equipped with a cathode-ray tube permits visual determination of the magnitude and characteristics of distortions in each transmitted signal. TITLE: Formation conditions of anatoxins of Clostridium perfringens, Cl.  
Oedematiens and Cl. septicum from toxins obtained in meatless media

SOURCE: Mikrobiologichnyy zhurnal, v. 28, no. 4, 1966, 56-61

TOPIC TAGS: toxoid, toxin, clostridium perfringens, Clostridium oedematiens,  
Clostridium septicum, bacteria toxin

ABSTRACT: Detoxification conditions for Clostridium perfringens, Cl. oedematiens  
and Cl. septicum toxins were studied. Cl. perfringens is best denatured by adding  
two doses of 0.3 and 0.2% formaline at 24-hr-intervals, while maintaining the pH

Card 1/2

L 05134-67

ACC NR: AP6031134

of the medium between 7.2-7.4, and the temperature at 38C. Detoxification takes seven to ten days under these conditions. The antitoxin-fixing activity of the toxiod obtained fluctuates between 4 and 8 EC with the native toxin titer being 400-800 Dlm/ml. The best procedure for denaturation of *C. oedematiens* toxin is addition of 0.4% Formalin. A temperature of 38C is maintained for two days, followed by storage at room temperature for 5-7 days. Toxoids with antitoxin-fixing activities of 70--120 EC and a native toxin activity of 15,000--22,000 Dlm/ml were obtained. The *C. septicum* was denatured with minimum loss of antitoxin-fixing properties by the addition of two consecutive doses of 0.15 and 0.1% Formalin, at 38C for two days with subsequent storage at room temperature for 5-7 days. The resulting toxoids have an activity of 2--4 EC with native toxin titers of 200--400 Dlm/ml. [Based on authors' abstract] [W.A.50] [GC]

TITLE: On Problems of Rock Disintegration (Voprosy razrusheniya gornykh porod) Transactions of the Conference in the Mining Institute (Soveshchaniye v Institute gornogo dela)

PERIODICAL: Vestnik Akademii nauk SSSR, 1958, Nr 8,  
pp. 130 - 132 (USSR)

ABSTRACT: This coordination conference was held from May, 20 - 22. It was called by the Institut gornogo dela Akademii nauk SSSR (Mining Institute AS USSR). Representatives of scientific research institutes, of universities, of planning bureaux and manufacturing plants participated in the work. The following lectures were held:

B.M.Leyboy on methods of evaluating coal structure.  
M.M.Protod'yakonov and B.M.Loguntsov on the standardization and the establishment of a uniform scale of drilling work.  
A.N.Zelenin on a more precise method of the determination of limit values of rock stress values.  
V.S.Kravchenko, A.P.Obraztsov and D.A.Denisov on the application of magnetic high-frequency fields for the breaking
